Dr. Kansas Penuma Pre- and Post-Op

Procedure is done as an outpatient. You will go home the same day with a drain in place, the nurses will teach you how to use the drain properly.

There will be a single incision on the side of the scrotum and is approximately 1.5 inches in length.

Please use ice packs to the incision penis and scrotum most of the day until we see you for follow up (20 min on 20 min off).

Expect the drain to put out up to 200-400 ml's a day, this will slow down and likely dry up before we remove the drain.

It is ok to remove the dressing I place in the OR on post op day 1 and take a quick shower.

Please start to use the Tubigrip size A or Urowrap 4 cm after the initial dressing is removed. Boxes are available on multiple sites on the internet for \$20-30 (urowrap.com or amazon) . This should be changed daily and worn from when you get up in the morning until when you go to bed. No need to wear while sleeping. 1 box will last the 6 weeks I like you to use the Tubigrip/Urowrap.

My P.A. or I will see you on post op day 2 and remove the drain.

I will prescribe Pain meds, antibiotics, stool softeners and Nitro-Bid ointment the day f your surgery. The Nitro-Bid should be applied to the last 1 inch of the shaft on the top each night to promote blood flow to the skin. This will b used for 4-6 weeks.

It is ok to apply Neosporin or other ointments to the incision but it is not necessary it will heal well without using this.

Please shower at least once a day and clean the incision, scrotum and penis well with soap and water.

Please be aware that you will have pain for 2 weeks and you will have soreness for 8-10 weeks. Please be aware that there will also be swelling in the shaft, it will look like fluid under the skin over the implant for 6-8 weeks. This is all normal. Night time erections will be impressively uncomfortable as well.

Please do not manipulate the implant for at least 6 weeks. No sex or masturbation for a minimum of 6 weeks.
